

Could calcium and thyroid problems be related to a genetic condition?

Information for patients and families

Reading this pamphlet can help you:

- Discover how having low calcium levels and thyroid problems may be related to a genetic condition called 22q11.2 deletion syndrome
- Learn more about 22q11.2 deletion syndrome:
 - What it is
 - How best to care for it

What causes calcium and thyroid problems?

As part of your care, your endocrinologist will be treating your calcium and/or thyroid problems. There are many possible causes of such problems. Some are related to genetic conditions. One genetic condition that can cause calcium and thyroid problems is **22q11.2 deletion syndrome (22q11.2DS or 22q)**. People with 22q are missing a tiny piece of one chromosome in each cell of their body. This can cause a wide range of health problems. A blood test can detect a 22q deletion.

What does 22q11.2 deletion syndrome mean?

22q11.2

- **22** refers to chromosome 22. Chromosome 22 is one of 23 pairs of chromosomes in every cell of your body. Everyone has 2 copies of chromosome 22. One copy is inherited from each parent.
- **q** is the long arm of chromosome 22. Each chromosome has a short arm and a long arm.
- **11.2** is a specific location on chromosome 22.

Normal chromosome 22

Chromosome 22 with q11.2 deleted

Deletion

A tiny piece of a chromosome is missing or 'deleted'.

Syndrome

A health condition with many features.

What are some of the common features of 22q?

- Hypocalcemia (low calcium levels)
- Thyroid problems
- Learning difficulties and/or intellectual and developmental disabilities
- Palate problems and a nasal voice
- Psychiatric issues such as anxiety and/or schizophrenia
- Congenital heart defects (heart defects present from birth)
- Seizures, epilepsy

22q is a condition that affects many areas of the body. People with 22q are affected in different ways, even if they are from the same family. The number and severity of features vary from person to person.

Many adults have not yet been diagnosed with 22q because of the wide range of possible symptoms. Also, many medical professionals may not recognize the symptoms as 22q.

What causes 22q?

About 1 in 2,000 people are born with 22q. Newborns are not tested for this syndrome on standard newborn screening.

Usually the 22q deletion occurs as a new genetic change in a family. In other words, it is not usually passed down (inherited) from a parent. Only about 1 out of 10 people with the 22q deletion has a parent who is also affected. In either case, nothing the parent did, or did not do, caused the deletion to happen.

How can I find out if I have 22q?

Your doctor may order a blood test to look for the 22q deletion if your calcium level is low, and especially if there is also another feature of 22q, such as:

- Learning difficulties and/or intellectual disability
- Palate problems and a nasal sounding voice
- Congenital heart defects
- Psychiatric issues such as anxiety and/or schizophrenia

If you have features of 22, your doctor can also refer you to The Dalglish Family 22q Clinic to be diagnosed. **Genetic testing is recommended for everyone with intellectual and developmental disabilities.**

Knowing the diagnosis can benefit you in these ways:

- ✓ Your doctors will have more information when they take care of you.
- ✓ You and your doctors may be able to better plan for health related issues before they happen.
- ✓ You can get the help that you need, such as social and/or financial support.
- ✓ You can have genetic counselling and get access to specific resources to learn about this diagnosis and the chances of having children who are also affected.

What happens if I have 22q?

Most adults with 22q manage well with support and health care tailored to their specific needs.

If you have 22q, your doctor can refer you to The Dalglish Family 22q Clinic, which is located at the Toronto General Hospital. This is a specialty clinic with a team of health care providers who are familiar with the syndrome. See page 6 for referral information.

Depending on your needs, you may have appointments with one or more of these health care providers:

- **Genetics expert in 22q**
- **Psychiatrist**
- **Endocrinologist**
- **Neurologist**
- **Social Worker**
- **Registered Dietitian**

Cardiologists from the **Toronto Congenital Cardiac Centre for Adults (TCCCA)** are an important part of the Dalglish Clinic team.

The health care providers involved in your care will:

- Provide timely and effective care for 22q
- Provide regular and careful monitoring of your health
- Give you information and support
- Connect you with local resources and peer support as needed
- Help coordinate care
- Provide recommendations to your local clinicians
